FIT3178 – iOS App Development

D2 – Application Testing Report

Template: FIT3178 D2 Submission Template

Generative AI may be used for proofreading, grammar checking, and formatting only. Generative AI must not be used to generate testing results, bug reports, or reflections that do not accurately represent testing you have performed.

This task asks you to evaluate the quality of your iOS application by planning, conducting, and documenting testing throughout the development process. You will identify issues, evaluate the effectiveness of your implementation, and reflect on how testing improved your application.

Show us that you can:

- Develop and execute a structured testing process
- Evaluate the functionality and usability of an iOS application
- Identify, document, and resolve software defects
- Reflect on the effectiveness of your testing process
- Demonstrate an understanding of software quality assurance

Give us:

- A PDF testing report
    - A summary of your testing approach
    - Evidence of testing completed
    - A record of defects identified and their outcomes
    - A reflection on the testing process and improvements made to the application

We will check that you have:

- Tested the major functionality of your application
- Documented test cases and expected outcomes
- Recorded the results of testing accurately
- Identified and addressed defects where appropriate
- Reflected on the strengths and limitations of your application
- Supported your report with appropriate evidence

Do the following:

1. Describe your testing strategy

2. Identify the major features of your application that require testing

3. Create a series of test cases that include:
    a. The feature being tested
    b. The purpose of the test
    c. The expected outcome
    d. The actual outcome
    e. Whether the test passed or failed

4. Test your application under a range of normal and unexpected user interactions

5. Record any defects or issues identified during testing by describing:
    a. The problem encountered
    b. The severity or impact of the issue
    c. Whether the issue was resolved

6. Include evidence of your testing. Evidence may include:
    a. Screenshots of successful functionality
    b. Screenshots of identified issues
    c. Testing tables or checklists
    d. Annotated images
    e. Other relevant testing artefacts

7. Complete a testing reflection discussing:
    a. The most significant issue identified during testing.
    b. Improvements made as a result of testing.
    c. Any known limitations that remain.
    d. How testing influenced the overall quality of your application.

Expected Length?

Write as much or as little as is necessary to communicate your testing process clearly. The quality of your testing and reflection is more important than the overall length of the report.

Academic Integrity and Authenticity

This assessment is designed to evaluate your own testing process and understanding of software quality. To support academic integrity:

- All testing results must accurately represent testing performed on your own application
- Screenshots and evidence should be taken from your application
- You may be asked to discuss your testing process and demonstrate how identified issues were resolved
- Fabricated testing results or generic reports that could reasonably apply to any application will not satisfy the requirements

- Any external tools or resources used during testing should be appropriately acknowledged

Assessment Criteria

1. Quality and completeness of the testing strategy
2. Coverage of application functionality
3. Quality of documented test cases and results
4. Identification and management of software defects
5. Quality of supporting testing evidence
6. Depth of reflection on the testing process and application quality
